Elevation/depression and bearings

6 questions | 13 marks

Equivalent correct methods earn the corresponding marks.

1. A vertical tower is 16 m horizontally from an observer at ground level. Its top has elevation 35°. Find its height to one decimal place. [2 marks]

$h=16\tan 35°$.

$h\approx 11.2$ m.

Answer: 11.2 m

2. Repeat the tower calculation if the observing instrument is 1.5 m above the ground. [2 marks]

The trigonometric rise is still $16\tan 35°$.

Add the instrument height 1.5 m.

$H\approx 12.7$ m.

Answer: 12.7 m

3. From an 8 m high platform, a boat is seen at a depression of 25°. Find its horizontal distance from the platform base. [2 marks]

The boat's elevation angle to the platform is 25°.

$\tan 25°=8/d$, so $d=8/\tan 25°$.

$d\approx 17.2$ m.

Answer: 17.2 m

4. A point is 14 km east and 20 km north of a station. Find its bearing to the nearest degree. [2 marks]

$\beta = \tan^{-1}(14/20) = 34.992\ldots°$.

It lies in the north-east quadrant, so the bearing is 035°.

Answer: 035°

5. Find the reverse bearing of 032°. [2 marks]

$032° + 180° = 212°$.

Answer: 212°

6. A boat travels 24 km on bearing 210°. Find its southward and westward distances, each to one decimal place. [3 marks]

$E = 24\sin 210° = -12$ km.

$N = 24\cos 210° \approx -20.7846$ km.

The negative signs mean west and south respectively.

Answer: 20.8 km south; 12.0 km west
