Angles around a point

6 questions | 12 marks

Equivalent correct methods earn the corresponding marks.

1. Three angles around a point are 90°, 130° and x. Find x. [2 marks]

360° − (90° + 130°) = 140°.

Answer: 140°

2. Four angles around a point are 65°, 95°, 110° and x. Find x. [2 marks]

65 + 95 + 110 = 270.

360 − 270 = 90.

Answer: 90°

3. One angle is 120°. The other two angles around the point are equal. Find each equal angle. [2 marks]

360° − 120° = 240°.

240° ÷ 2 = 120°.

Answer: 120°

4. Six equal angles fill a full turn. Find each angle. [1 mark]

360° ÷ 6 = 60°.

Answer: 60°

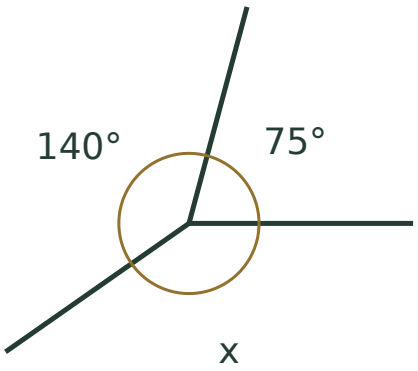

5. Mia lists angles of 90°, 90°, 80° and 90° for one complete turn. What is wrong? [2 marks]

90 + 90 + 80 + 90 = 350.

A full turn is 360°, leaving a 10° gap.

Answer: They total 350°, so 10° is missing.

6. Three angles around a point are 75°, 140° and x. Draw a rough sketch, find x and check the total. [3 marks]

Angles around a point

75° + 140° = 215°.

360° − 215° = 145°.

75° + 140° + 145° = 360°.

Answer: x = 145°
